

AS 20

The AS 20 laser axle measuring unit allows straightforward, rapid and accurate measurement and adjustment of all tractors and agricultural machines.

Tractors can be measured with or without turntables. The probes are positioned on the rim with 3 eccentric magnets.

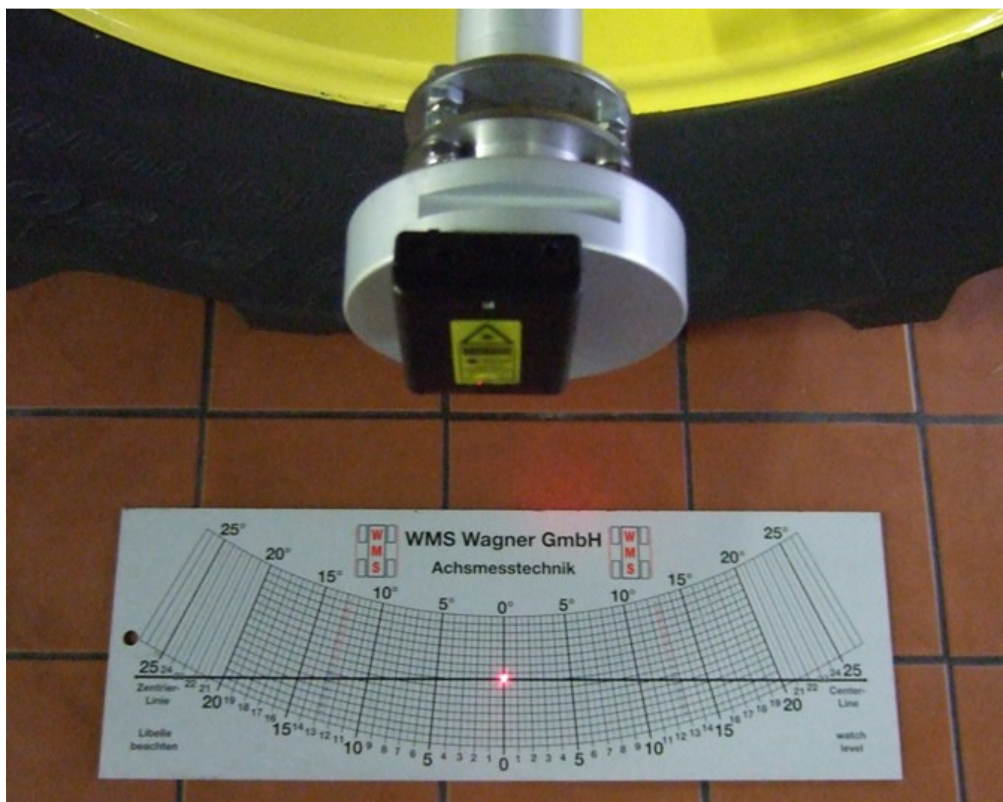

No external energy supply is required.

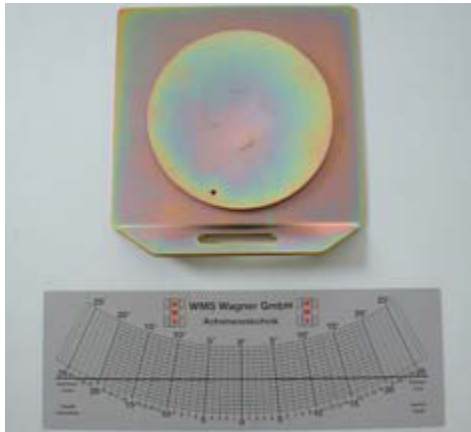

Precise laser axle measurement with 360° rotating laser and electronic inclinometer for camber and castor angle.
The laser unit can be adjusted, the robust laser support is made from solid material.

The track differential angle and castor angle are determined by the laser using a base scale with graduations.

Dirt-resistant turntables, specially developed for agricultural machines.

Suitable for straightforward and rapid determination of: Total toe - individual toe - steering position - camber - castor angle - track differential angle.

Setting in degrees/minutes and millimetres without calculation.
